

Incident Response Procedure

1. Identification

Security events are triaged by the on-call analyst within 15 minutes of alert generation. Each event is classified by severity.

2. Containment

Affected systems are isolated from the network to prevent lateral movement. Short-term containment actions are logged with a timestamp and the responsible analyst's identity.

3. Eradication

The root cause is identified and removed, including any malicious artifacts, unauthorized accounts, or persistence mechanisms.

4. Recovery

Affected systems are restored from known-good backups and monitored for recurrence before being returned to production.

5. Lessons Learned

A post-incident review is held within five business days to document root cause, response effectiveness, and follow-up actions.
